

Hands-On-Learning: Role-Based Security Training Simulation

Learning Objectives

By the end of this activity, learners will be able to:

- Design a realistic security awareness simulation tailored to a specific department and industry.
 - Define clear escalation steps for policy non-compliance identified during the simulation.
 - Propose a practical method for tracking training completion and effectiveness.
-

Description

This lab puts learners in the role of a cybersecurity training manager, a key implementation role within a governance program. They will design a targeted training intervention that addresses a specific, high-stakes threat—phishing in a healthcare context. The activity focuses on the practical skills of changing behavior and embedding accountability, which are central themes of Module 3.

Structure of the Activity

Tool used: Loom or ClickUp

Scenario

You are the Cybersecurity Training Manager for "HealthFirst Medical," a large healthcare organization. Recent internal reports show an increase in phishing attempts targeting the Human Resources (HR) department. You are tasked with developing a short, targeted training simulation to address this threat and ensure compliance with both internal policy and HIPAA requirements.

Objective

To design a storyboard for a phishing simulation and an accompanying process that includes clear escalation paths and a tracking method, demonstrating an understanding of role-based training and accountability.

Instructions for learners

Storyboard the Simulation:

Using Loom (to record a narrated presentation) or a ClickUp task description/whiteboard, create a storyboard for your training. It should include:

The pretext of the simulated phishing email. This must be realistic for an HR employee at a healthcare company (example, a fake alert about a new benefits portal, not a generic package delivery notice).

The "teachable moment"—what the user sees after they click the link.

A key policy reminder related to handling sensitive employee or patient health information.

Define Escalation Steps:

In your storyboard or a separate document, outline the process for what happens when an employee fails the simulation. This is your escalation path. (example, Step 1: Automated enrollment in remedial training. Step 2: Notification sent to their direct manager if remedial training is not completed in 48 hours). This demonstrates process design, not just content creation.

Outline Tracking Method:

Briefly describe how you would track the completion and effectiveness of this training initiative (example, "Using the corporate LMS to track completion rates" or "Monitoring user-reported phishing emails from the HR department over the next quarter to measure improvement").

Organize Information Following This Structure for Peer Review

- 1 Title Page:** Project title, your name, date.
- 2 Simulation Storyboard:** Provide a shareable link to your Loom video or ClickUp task/whiteboard.
- 3 Process Design Document:** Submit a brief document outlining your proposed Escalation Path and Tracking Method.
- 4 Realism Justification:** In one paragraph, explain why you chose your specific phishing pretext and how it is tailored to the risks faced by an HR department in a healthcare setting, considering regulation slike HIPAA.

Instructions for Documenting and Sharing the Project for Peer Review

1. Document the Project

Use word processing software to create your report.

Insert the diagram, map, screenshot, or image directly into your Word document, if available.

Ensure all sections of the project document structure are completed.

Proofread and edit your report for clarity and accuracy.

2. Share the Project

Save your report and presentation in PDF format.

Upload your documents to the “Peer Review” area in the course shell.

Provide a brief description of your project in the submission post.

3. Peer Review

Review the projects submitted by your peers.

Provide constructive feedback and comments on their work.

This activity gives learners a chance to apply the lesson by designing a complete, small-scale training program that moves beyond simple awareness to include accountability, measurement, and context-specific risk reduction.
